

Tropical Cloud and Precipitation Regimes and Vertical Structures as Seen from 15,896 TRMM and CloudSat/CALIPSO Match-up Cases

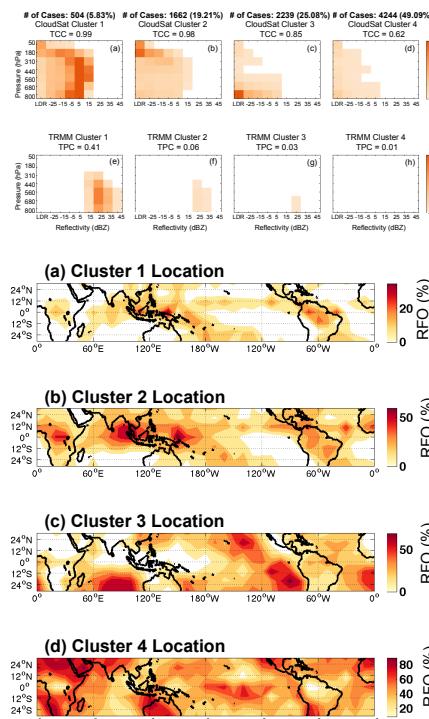

Z. JOHNNY LUO

Objective: Exploiting 15,896 TRMM and CloudSat/CALIPSO match-up cases within 20 min of each other (30S-30N), we investigated the internal vertical structures and regimes of tropical cloud and precipitation systems.

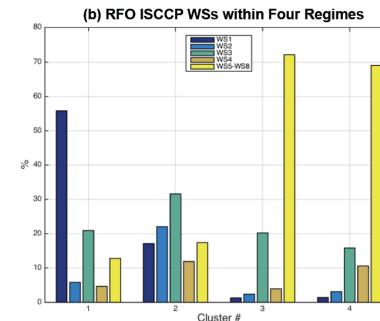

Note the complimentary and synergistic nature of PR and CPR/CALIOP: together, they almost fill up the entire H-dBZ space.

Four clusters/regimes are identified using k-mean cluster analysis

Comparisons with ISCCP Weather States show broad agreement, but also reveal differences due to different sampling strategies and viewing geometries
